

Gatekeeper setup to export agronomist's recommendations

Setting up Field Details in Gatekeeper.

In Gatekeeper there are 2 areas in the field setup that need to be checked to ensure they are complete.

In the Gatekeeper Home screen, click on Setup, then on Fields in the drop-down menu. Double click a field and go to Field details where the screen above is located.

3 items that need to be the same

1. **Farm Name** must be identical to the one in Geofolia – set in the Business setup screen.
2. **Field names** must be the same (Top red box)
3. **Field Reference** must be included. (2nd red box). This is generally the same as the field number E.g. 19, which a lot of Agronomists use and is located further down the screen. If this is the case the number must be repeated in the Reference box as shown. Geofolia uses the Field Reference NOT the field number.

Camp Field.19 **Field Details**
2018

Name:

Reference:

OS area: ha

Holding:

Field number: Optional field number that may be used as part of the field name but is NOT used when publishing to and from other Gatekeeper sites. If used this should be a unique number.

Map sheet:

NG Number:

NVZ region:

Soil Type

Texture:

SPR Soil risk code:

K release clay

Sulphur deficient

Default planned job field comment:

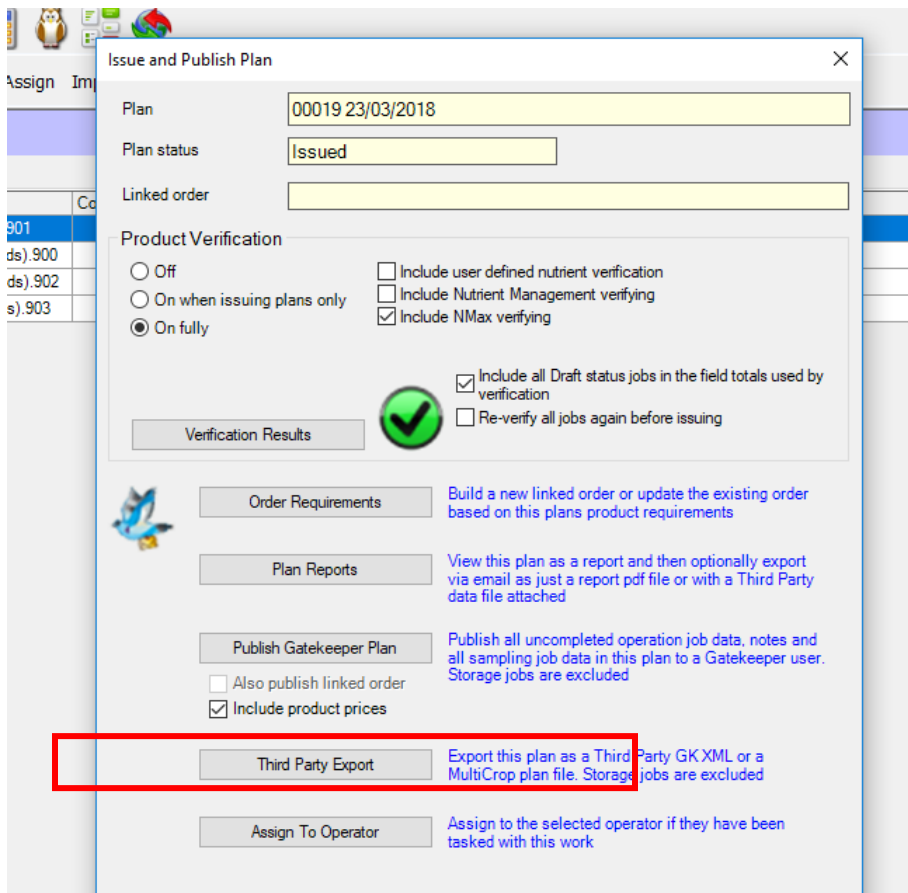

When adding fields to new cropping years this field will be
 Active Inactive

Once these data fields are complete for all fields we can now export the data.

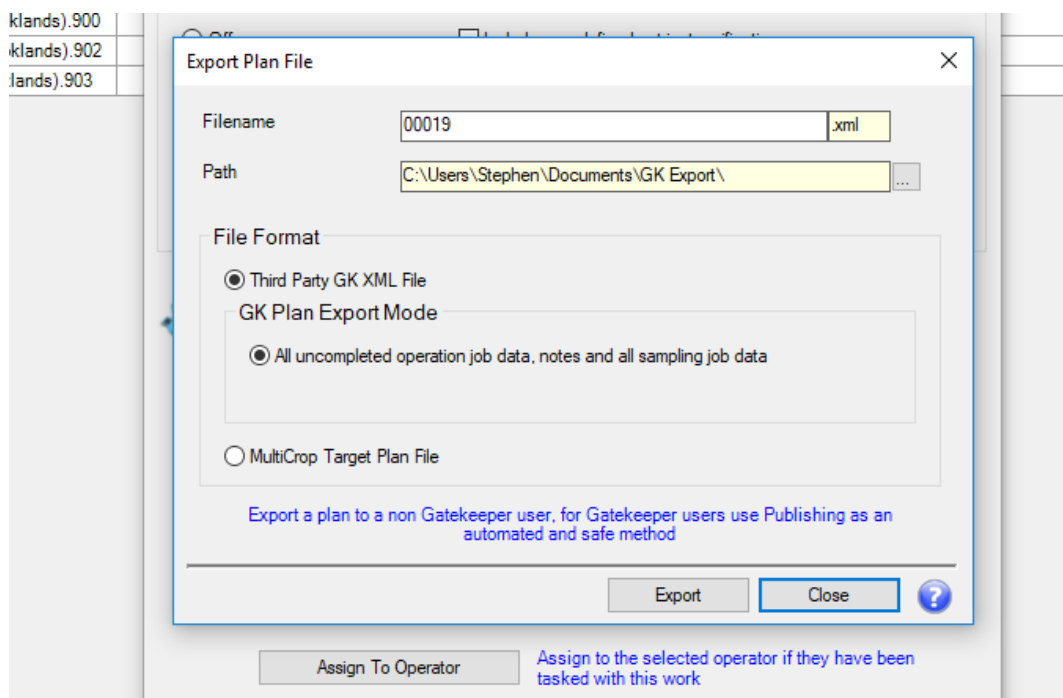

Export from Gatekeeper.

When the job is 'published' in Gatekeeper the following screen appears.

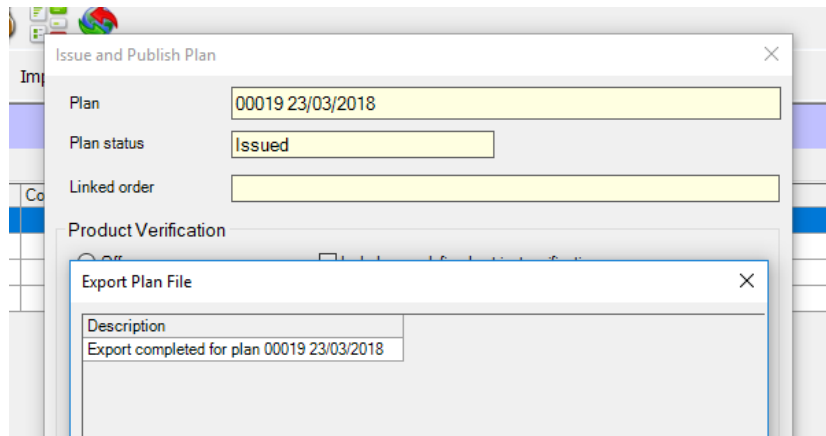

Choose 'Third Party Export' as this will export the file as the .xml file required for Geofolia import.

The next screen appears giving the file name and location. Save the .xml to a file on the 'C' drive.

The last screen shows the export has been successful.

The exported .xml can be seen in the file list.
